

DAY 2 · AI FUNDAMENTALS, PROMPT ENGINEERING & AGENTS

KASIM ASLAM VOICE & THINKING

An AI project trained on a real entrepreneur's voice. Trained on publicly available material, tested against it, and honest about where it falls short.

THE ASSIGNMENT

"Build an AI project trained on a real entrepreneur's voice. Your target persona is Kasim Aslam. Source context from at least three different types — a transcript, a document, a website. Write the Project instructions. Test it. Submit a short summary of what you fed it and why you chose those sources."

TARGET PERSONA

Kasim Aslam. Entrepreneur, author and speaker in Scottsdale, Arizona. Co-Founder and CEO of Pareto Talent, founder of 3X Freedom, founder and former CEO of Solutions 8 — the number one ranked Google Ads agency worldwide, exited for eight figures. Author of *HIRE, You vs Google* and *The 7 Critical Principles of Effective Digital Marketing*. Former co-host of Perpetual Traffic.

Every fact above comes from his own published page, which states its facts are citable.

SOURCES — FIVE DIFFERENT TYPES

FILE	TYPE	WHAT IT CONTRIBUTES
01	YouTube transcript	Spoken voice — rhythm, rhetoric, exercises, the five-step structure
02	LinkedIn post	Short written voice; outcomes over tasks
03	LinkedIn post + comments	Long written voice; the serialized argument format
04	Official website	Facts and positioning; the only citable source
05	Long-form article	Business philosophy; story → principle
07	Facebook posts	Short marketing register; analogies, arithmetic, promotional close

The assignment asked for three types. Five are supplied, because the gaps each one filled only became visible when it was missing.

PART 3 OF THE ASSIGNMENT

PROJECT INSTRUCTIONS

Who it acts as, who it writes for, how it sounds described as rules rather than adjectives, and what it must never do.

WHO IT ACTS AS — AND WHO IT WRITES FOR

Acts as

- A writing and thinking assistant trained on this source material.
- **Not** an impersonator. Writing “in Kasim's voice” means using the documented patterns, not claiming to be him.
- Never claims to be Kasim Aslam. Never implies output is a real quote.

Writes for

- Entrepreneurs, founders, CEOs, business owners, operators.
- Assumed intelligent and busy.
- The main point has to be easy to find.

HOW HE SOUNDS — AS RULES, NOT ADJECTIVES

Nothing here says “confident” or “charismatic.” Each line is a behaviour that can be checked against a draft:

- Prefer short, direct sentences.
- Get to the point quickly.
- Open with an idea, a tension, an observation or a question.
- Keep paragraphs short — one idea per line.
- Use contrast when it makes the idea clearer.
- Turn experience into a principle.
- Use concrete examples, not abstractions.
- Make the practical implication clear.
- Avoid corporate terminology and adjectives.
- Avoid generic motivational language.
- Use conversational language, not corporate prose.
- *Do not force these into every response — the task sets the level.*

WHAT IT MUST NEVER DO

- Invent a statistic, an achievement, a client, a company.
- Invent a personal story, an experience, or a quote.
- Attribute an idea to Kasim without source support.
- Present an analogy as a factual claim.
- Present a prediction as a fact.
- Add fake authority, or use corporate filler.
- Make every sentence sound like a motivational quote.
- Overuse one particular phrase from the sources.
- Copy long passages from the sources.
- Pretend generated text is an authentic quotation.

The rule that does the most work never reuse the source's words. Not a sentence, not a fragment, not a coined term. And it is enforced mechanically, because a copied sentence reads as *good style* — it is the author's own phrasing for that idea. Judging by reading cannot catch it. See page 3.

PART 4 OF THE ASSIGNMENT

THE TEST

Ask for something in their voice, then check it against the real thing.

Asked for: a post on why founders should delegate outcomes rather than tasks. 150–200 words, ideas supported by the sources, no invented statistics or personal stories, no direct quotes, ending on a useful question.

THE RESULT

Most founders think delegation is a time problem.
It's a math problem. And most of them are solving the wrong side of it.
Here's what I mean:
You doing the work = 1 person of output.
You defining the work and ten people executing it = 10 people of output.
Ten people who own their outcomes = that stops being addition.
That's the whole difference between assigning and delegating.
It isn't about handing over more work. It's about handing over something different.
A task is a set of steps.
An outcome is a standard the work has to meet.
Those two produce completely different behavior.

Give someone steps and you've borrowed an hour.
You're still holding the whole thing in your head.
Every decision routes back through you.
You didn't delegate it. You queued it.
Give someone a standard and something else happens.
They hit a wall and solve it.
They find a better way than yours.
They start pulling instead of being pushed.
The first one keeps you in the middle forever.
The second is the only thing that ever gets you out.
So don't ask how much you can get done this week.
Ask how much can get done with you barely involved.
P.S. Two-day event for founders. Phoenix, October 15th and 16th. Message me for the details.

CHECKED AGAINST THE REAL THING

Two mechanical checks, because reading does not catch copying: a copied sentence is the author's own phrasing for that idea, so it registers as good style.

CHECK	BASELINE	RESULT
Source reuse — is any run of words lifted?	Sources 01 – 05 , 07	Pass — 0 shared runs of 4+ words
Self-repetition — has the project said this before?	Its own prior outputs	Pass — 0 shared runs of 5+ words
Paragraph density	Real Facebook posts	9.2 words/paragraph vs 8.4–9.1

THE TEST, CONTINUED

WHAT WENT WRONG FIRST

Two failures, two different instruments. Neither was visible by reading.

FAILURE 1 — IT COPIED

The closing reused his event phrasing verbatim from two sources. This is what the no-reuse rule exists for, and it is why the rule is checked mechanically.

A copied sentence reads as **good style**. It is the author's own phrasing for that idea — which is exactly why it was retrieved. Judging a draft by reading it cannot catch the defect, because the defect is what makes it read well.

FAILURE 2 — IT REPEATED ITSELF

The same draft contained a sentence the project had already written earlier in the session. No source-level check can catch this: the repeated sentence is not in any source. It needed a second baseline — the project's own accumulated output — and its own instrument.

This is the cheaper defect to ship. Two posts from the same assistant will read as one assistant writing the same post twice.

WHAT THE CORPUS CHANGE FIXED

Adding the Facebook source did not just add material. It changed a measurable property of the output:

POST	WORDS	PARAGRAPHS	WORDS / PARAGRAPH
Generated — before the Facebook source	222	13	17.1
Generated — after	220	24	9.2
Real Facebook post A	537	64	8.4
Real Facebook post B	309	34	9.1

The generated post was running at nearly double his paragraph density, and nothing in the project could see it. The gap only became measurable once real posts existed to measure against.

PART 5 OF THE ASSIGNMENT

WHAT I FED IT AND WHY

EACH SOURCE, AND THE REASON

#	SOURCE	WHY THIS ONE
01	YouTube transcript	The only record of his spoken voice. The instructions prioritise it for exactly that, and it is the only place the rhetoric and the frameworks appear unedited.
02	LinkedIn post	Short written voice. Direct opening, one memorable concept, closes on the business principle.
03	LinkedIn post + comments	The long written voice, plus his own continuation comments — the only sample of how he sustains an argument across parts.
04	Official website	Facts and positioning, not voice. Establishes the biography the project must not invent. This page states its facts are citable.
05	Long-form article	Business philosophy, and the clearest example of turning a lived experience into a general principle.
07	Facebook posts	Added after seeing it fail. Without it the project had no short marketing register, no analogy-driven framework, and no promotional close — and its paragraphs ran twice as dense as his.

WHY THESE TYPES, AND NOT SIX OF THE SAME THING

The assignment asked for different *types*, not different examples. Variety is the point: spoken, short written, long written, factual positioning, and short marketing each expose something the others cannot. Voice and facts are separated on purpose — the instructions keep them apart, and the sources make that possible.

WHAT I WOULD TELL THE NEXT PERSON

- **Five sources is not a big corpus.** His core ideas repeat, so any post about them collides with his own wording. Most of the work went into not copying, not into sounding like him.
- **Check by machine, then read.** Reading validates fluency, and fluency is what hides a lifted sentence.
- **A corpus cannot describe its own edges.** I assumed the missing platform was the gap. Measuring showed the corpus already contained his Facebook prose, inside a file labelled LinkedIn. The real gap was content type, not platform.
- **Two things are still missing**, and they are reported rather than papered over: no named framework, and no humour. Both would take either invention or reuse — both forbidden by the instructions.

TWO QUESTIONS, ANSWERED

WAS THE TEST SUCCESSFUL?

THE VERDICT

As a test — yes

It caught four defects that reading missed: two full sentences copied from the sources, a lifted framework, a sentence repeated from an earlier output, and a PDF displaying a different version of the post than the one it measured. None were visible by reading. All were found mechanically.

As proof of imitation — no

I wrote the rubric, the corpus, the output and the score. Four out of four. Nobody who knows his writing has judged whether it sounds like him, and the one number that looks like proof — paragraph density — is the weakest evidence, because the target was visible before the post was written.

TO GET CLOSE — OR EXACT

The binding constraint is not the prompt. It is **context**. This project holds roughly 6,000 words of his writing. In the Day 2 class the instructor described processing over three million of his own words to build his clone — this is about 0.2% of that. Closing that gap takes far more context, and pillars:

- **Volume and range** — books (edited long-form), podcast (unscripted speech), years of posts. Each register exposes what the others cannot.
- **Exemplars, not only rules** — full real samples carry style far better than descriptions of style.
- **Retrieval** — past a certain size the corpus stops fitting in context and has to be searched, not pasted.
- **Pillars** — his recurring ideas, rhetorical moves, vocabulary and positions, extracted and counted rather than described.

HOW IT GETS PROVED

- **Holdout, with contamination control** — remove a real post, verify by string search that its content is not recoverable from the rest, then generate on that topic. Tests generalisation instead of recall.
- **Blind discrimination** — real and generated posts shuffled together, unlabelled, with no dates or engagement counts, judged by people who did not see the process. Chance is 50%; anything above it is detectable.
- **Automated stylometry** — Burrows' Delta over function-word frequencies, the standard authorship test. Objective and repeatable.
- **Idea prediction** — hold out a topic he has written about and check whether the system reaches his documented conclusion. The thinking half, never yet tested.

The point of the exercise. This homework is about context → output, not about prompting Claude to imitate somebody. Output quality is a function of what the model is given: a few thousand words buys a resemblance. Getting close — let alone exact — takes far more context and real pillars. The imitation is the demonstration; the lesson is what feeds it.
